

# Turbine – SSRF

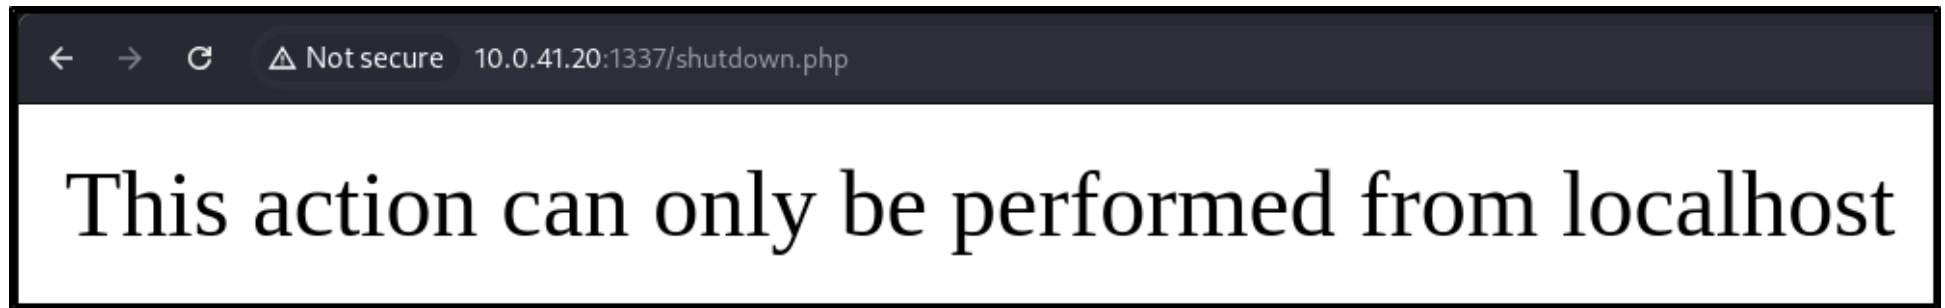

This application has a button which is supposed to “shut down” the turbine

# Turbine – Localhost Restricted

But we can't access the page, and we get an error message indicating that this page can only be accessed from the localhost

# Turbine – Localhost Restricted

To solve the challenge, we'll need to force the app to return local-access content, which would be an example of Server-Side Request Forgery (SSRF)

# Turbine – Additional Requests

If we take a look at the requests in Burp Suite, we see that after each request we make the server, we make a request to the `/refresh.php` page

# Turbine – Resource Access via Parameter

```
Request
Pretty Raw Hex
1 GET /refresh.php?endPoint=/api/
2 HTTP/1.1
3 Host: 10.0.41.20:1337
```

The most important part of this request is the URL parameter `endPoint`, which implies the parameter is used to load in other resources

# Turbine – Resource Access via Parameter

```
Request
Pretty Raw Hex
1 GET /refresh.php?endPoint=/shutdown.php
2 HTTP/1.1
```

We know we need to access the `shutdown.php` endpoint to finish the challenge, so we can try accessing it through the `refresh.php` page's `endPoint` parameter

# Turbine – SSRF Confirmed

```
7 Access-Control-Allow-Origin: *  
8 Content-Length: 82  
9  
10 Youshutthesystemdown...Hereisafлаг
```

And we're able to use the Server-Side Request Forgery to access the local-only endpoint  
shutdown.php
